database->loadRowList

Returns an array of database rows with numeric column indexing.Â Returns null if the query fails.

Syntax

array loadRowList ([string $key])

$keyis a field name. If $key is empty then loadRowList will return a sequential list of the database records returned by the current query. If $key is not empty then the array will be indexed by the value of the database key. This parameter is optional and if omitted will default to empty.

Examples

Example: This function prints an array containing records from the Joomla categories table.Â Note that in this example the array is indexed by the category title field.

```
function getCategories() {
  global $database;

  $sql = "SELECT * FROM #__categories";
  $database->setQuery( $sql );
  $categories = $database->loadRowList( 'title' );
  print_r( $categories );

}

getCategories();
```

might produce:

```
Array
(
    [Latest] => Array
        (
            [0] => 1
            [id] => 1
            [1] => 0
            [parent_id] => 0
            [2] => Latest
            [title] => Latest
            [3] => Latest News
            [name] => Latest News
