phpDocumentor

database->Quote

Returns a quoted string with all characters that have special meaning for the database escaped. This function is the same as database->getEscaped except that the string returned is surrounded by single quotes.

Syntax

string Quote (string \$text)
\$text is the raw string to be escaped and quoted.

Examples

Example:

```
function doQuery( $text ) {
    global $database;

    $text = $database->Quote( $text );
    $sql = "SELECT * FROM #__content WHERE introtext=$text";
    $database->setQuery( $sql );
    if (!$database->query()) {
        echo $database->stderr();
        return false;
    }

    echo $database->getQuery();
}

doQuery( "Joomla 4.5 is 'Power in Simplicity!'" );
```

might produce:

```
SELECT * FROM mos_content WHERE introtext='Joomla 4.5 is \'Power in Simplicity\''
```
