database->loadObject

Loads an object with fields from the first row returned by the current SQL query. If an object is passed as a parameter the fields of the row are bound to it and the updated object is returned.

Syntax

```
boolean loadObject ( object &$bind_object )
```

`$bind_object`

is the object that will be updated from the first row returned by the SQL query. If `$bind_object` is null then `loadObject` will create an object containing all fields from the first row of the SQL query.

Examples

Example: In this example we allow `loadObject` to create an object for us.

```
function getUser() {
    global $database;

    $sql = 'SELECT * FROM #__users';
    $database->setQuery( $sql );
    $user = NULL;
    $database->loadObject( $user );
    echo "Name: $user->name\n";
    echo "Username: $user->username\n";
}
```

```
getUser();
```

might produce:

Name: Administrator

Username: admin
