database->loadRowList

Returns an array of database rows with numeric column indexing. Returns null if the query fails.

Syntax

```
array loadRowList ( [ string $key ] )
```

\$key is a field name. If \$key is empty then loadRowList will return a sequential list of the database records returned by the current query. If \$key is not empty then the array will be indexed by the value of the database key. This parameter is optional and if omitted will default to empty.

Examples

Example: This function prints an array containing records from the Joomla categories table. Note that in this example the array is indexed by the category title field.

```
function getCategories() {
    global $database;

    $sql = "SELECT * FROM #__categories";
    $database->setQuery( $sql );
    $categories = $database->loadRowList( 'title' );
    print_r( $categories );
}

```

```
getCategories();
```

might produce:

```
Array
(
    [Latest] => Array
        (
            [0] => 1
            [id] => 1
