database->stderr

Returns the last database error message in a standard format. The error number and error message are included. The SQL statement that caused the error may optionally be included.

Syntax

```
string stderr ( [ boolean $showSQL ] )
```

`$showSQL` is a flag. If true then the error message will include the SQL statement that caused the error; otherwise the SQL statement will be omitted. This parameter is optional and if omitted will default to false.

Examples

Example:

```
$query = "SELECT * FROM 'bad_table'";
$database->setQuery( $query );
$rows = $database->loadObjectList();
if ($database->getErrorNum()) {
    echo $database->stderr();
}
```

which would output:

```
DB function failed with error number 1064<br />
<font color="red">You have an error in your SQL syntax
    near "bad_table" at line 1 SQL=SELECT * FROM 'bad_table'</font>
```

which would render as:

```
DB function failed with error number 1064
You have an error in your SQL syntax near "bad_table" at line 1 SQL=SELECT * FROM 'bad_table'
```

Please report any errors on this page to the [Developer Documentation Forum](#).
