phpDocumentor mosDBTable constructor

This is the constructor for the mosDBTable class. Can be overloaded/supplemented by the child class.

Syntax

```
void mosDBTable ( string $table, string $key, object &$db )
```

\$table is the name of the table in the database schema relating to the child class.

\$key is the name of the primary key field in the table.

\$db is a database connector object (an object of type database).

Examples Example: This is an example of a class called myTable which is associated with the database table called jos_myTable

and contains three fields. Notice how the constructor calls the parent constructor to set up the database connector object.

```
/**
 * myTable database table class
 * @package MyComponent
 */
class myTable extends mosDBTable {
    /** @var int Primary key */
    var $id=null;
    /** @var string */
    var $title=null;
    /** @var string */
    var $published=null;
    /** @var boolean */

    /**
     * @param database A database connector object
     */
    function myTable( &$db ) {
        $this->mosDBTable( '#__myTable', 'id', $db );
    }
}
```
