phpDocumentor

mosDBTable->getPublicProperties

Returns an array of public properties in the class. A public property is defined as one with a name that does not begin with an underscore.

Syntax

array getPublicProperties ()

Examples

Example: In this example notice that the `$_private` property is not included in the array.

```
/**
 * myTable database table class
 * @package MyComponent
 */
class myTable extends mosDBTable {

    /** @var int Primary key */
    var $id = null;
    /** @var string A title */
    var $title = null;
    /** @var string A description */
    var $description = null;
    /** @var string Private property */
    var $_private = null;
    /** @var boolean Published flag */
    var $published = null;

    /**
     * @param database A database connector object.
     */
    function myTable( &$db ) {
        $this->mosDBTable( '#__myTable', 'id', $db );
    }

}
```

```
global $database;
```

```
$table = new myTable( $database );
print_r( $table->getPublicProperties() );
```

which will output:

```
Array
(
    [0] => id
    [1] => title
    [2] => description
    [3] => published
)
```
