mosDBTable->hit

Generic hit count update. This method may be overloaded/supplemented by the child class as required.

This method increments the 'hit' column in a specified table row in the database.

If the `$mosConfig_enable_log_items` configuration variable is true then it also adds an entry to the `jos_core_log_items` database table.

Syntax

```
void hit ( [ int $id ] )
```

`$id` is the primary key id for the record to be updated. This parameter is optional and if omitted will default to null.

Examples

Example: In this example the hit counter for a specific content record is incremented.

```
global $database;
```

```
// Declare an instance of the content class.  
$content = new mosContent( $database );
```

```
// Increment the hit count for a content record.  
$uid = 5;  
$content->hit( $uid );
```
