mosDBTable->publish_array

Generic publish/unpublish function. Returns true if successful; false otherwise. If returning false then an error message can be retrieved using the mosDBTable->getError function.

Note: In Joomla! 1.0.4 this method does not return a boolean and so it is not possible to determine if the method succeeded or not.

Syntax

```
boolean publish_array ( array $id [, int $publish [, int $myid ] ] )
```

\$id is an array of primary keys for records to be published or unpublished. If the array is empty then publish_array will return false.

\$publish is 0 to unpublish or 1 to publish. This parameter is optional and if omitted will default to 1 (publish).

\$myid is the id of the user performing the operation. This parameter is optional and if omitted will default to 0.

Examples

Example: In this example menu records with particular item id's are unpublished.

```
global $database, $my;
```

```
// Declare an instance of the menu class.
```

```
$menu = new mosMenu( $database );
```

```
// Create an array of record id's to be unpublished.
```

```
$idarray = array( 2, 3, 5 );
```

```
// Unpublish the menu records with these id's.
```

```
$menu->publish_array( $idarray, 0, $my->id );
```
