mosDBTable->isCheckedOut

Generic function that tests if the current item is checked out. This method may be overridden/supplemented by the child class as required.

This method was introduced in Joomla 1.0.

See also the mosDBTable->checkin and mosDBTable->checkout methods.

Syntax

```
boolean isCheckedOut ( [ int $user_id ] )
```

\$user_id is an optional user id. If omitted (or zero) this function will return true if the current item is checked out or false if not. If a user id is specified then this function will only return true if the current item is checked out by a different user.

Examples

```
global $database, $my;
```

```
// Declare an instance of the mosCategory class.
```

```
$cat = new mosCategory( $database );
```

```
// Load record with primary key id 1.
```

```
$uid = 1;
```

```
if (!$cat->load( $uid )) {
```

```
    echo "Cannot load category record $uid: " . $database->stderr();
```

```
}
```

```
// Show some fields from this record.
```

```
echo "<br />";
```

```
echo "Title: $cat->title<br />";
```

```
echo "Description: $cat->description<br />";
```

```
// Check to see if the record has already beend checked out by someone else.
```

```
if ($cat->isCheckedOut( $my->id )) {
```

```
    echo "Record $uid is checked out by another user.<br />";
```

```
} else {
```

```
    echo "Record $uid is not checked out.<br />";
```

```
}
```

Which might output something like this:

Title: Latest

Description: The latest news from the Joomla! Team

Record 1 is not checked out.
